

AP Calculus Class 14

Homework 13.

$$5. \int_0^{\infty} x^2 e^{-x^3} dx = \lim_{t \rightarrow \infty} \int_0^t x^2 e^{-x^3} dx.$$

$$\text{let } u = -x^3$$

$$du = -3x^2 dx$$

$$-\frac{1}{3} du = x^2 dx$$

$$= \lim_{t \rightarrow \infty} \int_0^{-t^3} -\frac{1}{3} e^u du$$

$$= \lim_{t \rightarrow \infty} -\frac{1}{3} e^{-x^3} \Big|_0^t$$

$$= \lim_{t \rightarrow \infty} \left[-\frac{1}{3} e^{-t^3} - \left(-\frac{1}{3} e^{-0} \right) \right]$$

$$= \frac{1}{3}$$

C

$$3. \int_2^{\infty} \frac{1}{x^2} dx = \lim_{t \rightarrow \infty} \int_2^t \frac{1}{x^2} dx$$

$$= \lim_{t \rightarrow \infty} \left[-\frac{1}{x} \right]_2^t$$

$$= \lim_{t \rightarrow \infty} \left[\frac{1}{2} - \frac{1}{t} \right] = \frac{1}{2}$$

A

$$4. \int_1^{\infty} \frac{x}{(1+x^2)^2} dx = \lim_{t \rightarrow \infty} \int_1^t x (1+x^2)^{-2} dx$$

$$= \lim_{t \rightarrow \infty} \left[-\frac{1}{2} (1+x^2)^{-1} \right]_1^t$$

$$= \frac{1}{4}$$

C

$$1. e) \int \frac{1}{x^3-1} dx$$

$$x^3-1^3 = (x-1)(x^2+x+1)$$

$$a^3+b^3 = (a+b)(a^2-ab+b^2)$$

$$\Rightarrow \frac{1}{x^3-1} = \frac{A}{x-1} + \frac{Bx+C}{x^2+x+1}$$

$$\Rightarrow A(x^2+x+1) + (Bx+C)(x-1) = 1$$

$$\Rightarrow (A+B)x^2 + (A-B+C)x + (A-C) = 1$$

$$\Rightarrow A+B=0 \quad A-B+C=0 \quad A=C+1$$

$$\Rightarrow A = \frac{1}{3} \quad B = -\frac{1}{3} \quad C = -\frac{2}{3}$$

$$\Rightarrow \frac{1}{x^3-1} = \frac{\frac{1}{3}}{x-1} + \frac{-\frac{1}{3}x - \frac{2}{3}}{x^2+x+1} = \frac{1}{3(x-1)} - \frac{1}{3} \frac{x+2}{x^2+x+1}$$

$$\int \frac{1}{x^3-1} dx = \frac{1}{3} \int \frac{1}{x-1} dx - \frac{1}{3} \int \frac{x+2}{x^2+x+1} dx$$

$$\downarrow$$

$$I_1 \rightarrow \text{let } u = x-1$$

$$\downarrow$$

$$I_2$$

$$I_1 = \frac{1}{3} \int \frac{1}{u} du = \frac{1}{3} \ln u + C = \underline{\underline{\frac{1}{3} \ln|x-1| + C}}$$

$$I_2 = \int \frac{x+2}{x^2+x+1} dx$$

We will split the integrand into two parts.

$$\text{let } u = x^2 + x + 1 \quad du = 2x + 1 \, dx \quad \frac{1}{2} du = x + \frac{1}{2} \, dx$$

$$\Rightarrow x + 2 = x + \frac{1}{2} + \frac{3}{2}$$

$$I_2 = \int \frac{x + \frac{1}{2}}{x^2 + x + 1} \, dx + \int \frac{\frac{3}{2}}{x^2 + x + 1} \, dx$$

\downarrow
 I_{2a}

\downarrow
 I_{2b}

$$I_{2a} = \int \frac{\frac{1}{2}}{u} \, du = \frac{1}{2} \int \frac{1}{u} \, du = \frac{1}{2} \ln u + C$$

$$= \frac{1}{2} \ln |x^2 + x + 1| + C$$

$$I_{2b} = \frac{3}{2} \int \frac{1}{x^2 + x + 1} \, dx \quad (\text{complete the square}).$$

$$= \frac{3}{2} \int \frac{1}{x^2 + x + (\frac{1}{2})^2 - (\frac{1}{2})^2 + 1} \, dx$$

$$= \frac{3}{2} \int \frac{1}{(x + \frac{1}{2})^2 + \frac{3}{4}} \, dx$$

$$\int \frac{1}{u^2 + 1} \, du = \tan^{-1} u + C$$

$$\int \frac{1}{u^2 + a^2} \, du = \frac{1}{a} \tan^{-1} \left(\frac{u}{a} \right) + C.$$

$$= \frac{3}{2} \int \frac{1}{u^2 + (\frac{\sqrt{3}}{2})^2} \, du = \frac{3}{2} \left(\frac{1}{\frac{\sqrt{3}}{2}} \tan^{-1} \left(\frac{u}{\frac{\sqrt{3}}{2}} \right) + C \right)$$

$$= \frac{3}{2} \frac{2}{\sqrt{3}} \tan^{-1} \left(\frac{2(x + \frac{1}{2})}{\sqrt{3}} \right) + C.$$

$$= \sqrt{3} \tan^{-1}\left(\frac{2x+1}{\sqrt{3}}\right) + C$$

$$\int \frac{1}{x^3-1} dx = \frac{1}{3} \ln|x-1| - \frac{1}{6} \ln|x^2+x+1|$$

$$- \frac{1}{\sqrt{3}} \tan^{-1}\left(\frac{2x+1}{\sqrt{3}}\right) + C$$

Improper Integrals.

$$\int_1^{\infty} \frac{1}{x} dx$$

Type 2: Discontinuous Integrands

Definition of an Improper Integral of Type 2

a) If f is continuous on $[a, b)$ and is discontinuous at b , then

$$\int_a^b f(x)dx = \lim_{t \rightarrow b^-} \int_a^t f(x)dx$$

if this limit exists (as a finite number).

b) If f is continuous on $(a, b]$ and is discontinuous at $\overset{a}{\cancel{b}}$, then

$$\int_a^b f(x)dx = \lim_{t \rightarrow a^+} \int_t^b f(x)dx$$

provided this limit exists (as a finite number).

The improper integral $\int_a^b f(x)dx$ is called **convergent** if the corresponding limit exists and **divergent** if the limit does not exist.

c) If f has a discontinuity at c , where $a < c < b$, and both $\int_a^c f(x)dx$ and $\int_c^b f(x)dx$ are convergent, then we define

$$\int_a^b f(x)dx = \int_a^c f(x)dx + \int_c^b f(x)dx$$

a)

b)

c)

$$\int_a^b f(x) dx$$

$$\int_b^a f(x) dx = -\int_a^b f(x) dx$$

Example: $\int_2^5 \frac{1}{\sqrt{x-2}} dx$

The V.A. $x=2$. This is on the left end of $(2, 5]$.

Use part b) of the defⁿ.

$$\int_2^5 \frac{1}{\sqrt{x-2}} dx = \lim_{t \rightarrow 2^+} \int_t^5 \frac{1}{\sqrt{x-2}} dx$$

$$= \lim_{t \rightarrow 2^+} \left[2\sqrt{x-2} \right]_t^5$$

$$= \lim_{t \rightarrow 2^+} 2(\sqrt{3} - \sqrt{t-2}) = 2\sqrt{3}$$

\Rightarrow converges to $2\sqrt{3}$

Let $u = x-2$.

$$\rightarrow \int \frac{1}{\sqrt{u}} du$$

Example : $\int_0^3 \frac{1}{x-1} dx$

$$\int_0^3 \frac{1}{x-1} dx = \ln|x-1| \Big|_0^3 = \ln 2 - \ln 1 = \ln 2.$$

V.A. at $x=1$.

Since the V.A. is in between 0 and 3, use part c) of the defⁿ.

$$\int_0^3 \frac{1}{x-1} dx = \int_0^1 \frac{1}{x-1} dx + \int_1^3 \frac{1}{x-1} dx.$$

$$\int_0^1 \frac{1}{x-1} dx = \lim_{t \rightarrow 1^-} \int_0^t \frac{1}{x-1} dx$$

$$= \lim_{t \rightarrow 1^-} [\ln|x-1|]_0^t$$

$$= \lim_{t \rightarrow 1^-} \ln|t-1| - \ln|-1|$$

$$= \lim_{t \rightarrow 1^-} \ln(1-t) = -\infty$$

$$|x| = \begin{cases} x & \text{if } x \geq 0 \\ -x & \text{if } x < 0 \end{cases}$$

$$|t-1| = \begin{cases} t-1 & \text{if } t \geq 1 \\ -(t-1) & \text{if } t < 1 \end{cases}$$

$$= \begin{cases} t-1 & \text{if } t \geq 1 \\ 1-t & \text{if } t < 1 \end{cases}$$

$$\Rightarrow \int_0^1 \frac{1}{x-1} dx \text{ diverges.}$$

$\Rightarrow \int_0^3 \frac{1}{x-1} dx$ diverges b/c it does not satisfy part c) of the defⁿ.

$$\int_0^1 f(x) dx = -\infty$$

$$\int_1^3 f(x) dx = +\infty$$

$$-\infty + \infty \neq 0. \quad \neq a$$

$$+, -, \times, \div$$

$$\infty, \quad \infty + 1 = \infty$$

Example: $\int_0^1 \ln x dx$

V.A. is at $x=0$

Apply IBP.

$$\text{let } f = \ln x \quad g' = 1$$

$$f' = \frac{1}{x} \quad g = x$$

$$\Rightarrow \int_0^1 \ln x dx = [x \ln x]_t^1 - \lim_{t \rightarrow 0^+} \int_t^1 \frac{1}{x} \cdot x dx$$

$$= [x \ln x]_t^1 - \lim_{t \rightarrow 0^+} [x]_t^1$$

$$= 1 \ln 1 - t \ln t - (1 - t)$$

$$= -t \ln t - 1 + t$$

$$= \lim_{t \rightarrow 0^+} \underbrace{-t \ln t - 1 + t}$$

↓

Apply l'Hospital's Rule

$$\begin{array}{c} 0 \cdot (-\infty) \\ \uparrow \\ \lim_{t \rightarrow 0^+} t \ln t = \lim_{t \rightarrow 0^+} \frac{\ln t}{\frac{1}{t}} \stackrel{H}{=} \lim_{t \rightarrow 0^+} \frac{\frac{1}{t}}{-\frac{1}{t^2}} = \lim_{t \rightarrow 0^+} (-t) = 0 \end{array}$$

$\frac{\infty}{\infty}$ ↖

$$\Rightarrow \int_0^1 \ln x \, dx = \lim_{t \rightarrow 0^+} (-t \ln t - 1 + t) = 0 - 1 + 0 = -1.$$

Applications of Integration

f and g are continuous
 $f \geq g \quad \forall x \in [a, b].$

The area for one rectangular strip is $[f(x_i^*) - g(x_i^*)] \Delta x$.

$$A = \lim_{n \rightarrow \infty} \sum_{i=1}^n [f(x_i^*) - g(x_i^*)] \Delta x.$$

Defⁿ: The area A of the region bounded by the curves $y=f(x)$, $y=g(x)$ and the lines $x=a$, $x=b$, where f and g are continuous $f(x) \geq g(x) \forall x \in [a, b]$, is

$$A = \int_a^b [f(x) - g(x)] dx.$$

Example: Find the region bounded by
 $y = e^x$, $y = x$, $x = 0$, and $x = 1$.

$$y_T = e^x \quad y_B = x$$

$$a = 0 \quad b = 1$$

$$A = \int_0^1 e^x - x \, dx$$

$$= \left[e^x - \frac{1}{2}x^2 \right]_0^1$$

$$= e - \frac{1}{2} - 1 = e - \frac{3}{2}$$

Example: Find the area enclosed by the
 curves $y = x^2$ and $y = 2x - x^2$.

$$x^2 = 2x - x^2$$

$$\Rightarrow 2x^2 - 2x = 0$$

$$\Rightarrow 2x(x - 1) = 0$$

$$\Rightarrow x = 0 \quad \text{and} \quad x = 1.$$

$$A = \int_a^b \underset{\substack{\downarrow \\ y_T}}{f(x)} - \underset{\substack{\downarrow \\ y_B}}{g(x)} \, dx = \int_0^1 2x - x^2 - x^2 \, dx$$

$$= \int_0^1 2x - 2x^2 dx = 2 \int_0^1 x - x^2 dx.$$

$$= 2 \left[\frac{x^2}{2} - \frac{x^3}{3} \right]_0^1 = 2 \left(\frac{1}{2} - \frac{1}{3} \right) = \frac{1}{3}$$

$$A = \int_a^b |f(x) - g(x)| dx$$

Example: Find the area bounded by $y = \sin x$
 $y = \cos x$, $x = 0$, $x = \frac{\pi}{2}$

$$A = \int_0^{\frac{\pi}{2}} |\cos x - \sin x| dx = A_1 + A_2$$

$$= \int_0^{\frac{\pi}{4}} \cos x - \sin x dx + \int_{\frac{\pi}{4}}^{\frac{\pi}{2}} \underbrace{[-\cos x + \sin x]}_{\sin x - \cos x} dx$$

$$= [\sin x + \cos x]_0^{\frac{\pi}{4}} + [-\cos x - \sin x]_{\frac{\pi}{4}}^{\frac{\pi}{2}}$$

$$= \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}} - 0 - 1 + \left(-0 - 1 + \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}} \right)$$

$$= 2\sqrt{2} - 2.$$
